

Commissioning Assistant Logic

ProjectMind Workflow Pack

Main use

This feature reads a commissioning test script or IST checklist and cross-references it against known open punch-list items or incomplete installs.

The goal is to warn the team before testing starts, so a likely failure can be avoided instead of discovered late on site.

Example behavior

Temporary power energization	Likely fail	UPS delay blocks the test.
Switchgear functional test	Likely fail	Incomplete install is still open.
BMS integration test	At risk	I/O verification is pending.
Fire alarm interface	Pass	No blocking issue found.

Judge takeaway

- This reduces rework by predicting failure before the test w
- It is especially useful for commissioning managers and site
