

Geospatial Tracking Logic

ProjectMind Workflow Pack

Main use

This feature visualizes equipment shipment locations and status so the team can see which long-lead items are at risk and which downstream tasks are exposed.

It is a polished visual layer, but it still feeds the same project risk engine as the other pages.

Example behavior

UPS	In transit	Delays energization and installation.
Transformer	At dispatch hub	May shift procurement-critical tasks.
Chiller	On site	No major downstream exposure.
Switchgear	Customs clearance	Can affect commissioning readiness.

Judge takeaway

- The map makes the supply chain easy to read at a glance.
- Its biggest value is the schedule warning attached to each ship
